Dear Esteemed Customer,

Thank you for your interest in our company and our products. We are delighted to present an overview of Ventila and its range of fans in the opening page of our catalogue.

We manufacture welded centrifugal fans tailored to meet the needs of customers' various industrial applications. Specializing in customized, small-batch production, we take your requirements from design to finished product with precision and efficiency.

Our clients value our flexibility and expertise, which enable us to provide swift and tailored solutions to your projects.

The cornerstone of our product line is comprised of radial fans, offering airflow volumes ranging from 1,000 m<sup>3</sup>/h to 100,000 m<sup>3</sup>/h across low, medium, and high-pressure ranges. Should you not find the specific model you require in this catalogue, please do not hesitate to contact us for further information.

In addition to our radial fans range, we also offer axial fans, kindly contact us for further details for our industrial axial fan products which are available with three-phase, single-phase, or petrol-driven motors in various sizes.

We look forward to the opportunity to serve you and address your ventilation needs with our quality products and expertise.

Sincerely,  
Ventila Team.

#### Ventila, High Efficiency Industrial Centrifugal Fans:

At Ventila, we specialize in providing high-efficiency industrial centrifugal fans tailored to meet a diverse range of demands. Our fan spectrum encompasses solutions for various applications, from handling dust-laden mediums with extreme abrasion resistance using flame-sprayed armored blades to pressure-proof and comparative fan designs.

To cater to your specific needs;

- Hot gas fans up to 600°C,  
either with or without spiral housing
- Noise-Reduced Fans with a significant  
reduction in sound pressure levels.

- Fans made of special metal types,  
such as PP, aluminium or stainless steel.

Additionally, we provide a range of accessories shown in attachment to optimize the performance of your fan system.

If you're ready to explore our offerings further, don't hesitate to reach out. Our dedicated sales department is always available to assist you.

We look forward to the opportunity to demonstrate our capabilities and serve your industrial fan needs effectively. Contact us today!

## Fan Features

Our high-efficiency radial fans are engineered to meet the following specifications, making them versatile for various ventilating and industrial applications:

- Single Inlet Radial Fan: Constructed with a shaft made of S355J0 or specialized material, including a feather key and stud for impeller, hub, and pulley. The fan is equipped with fully mounted and lubricated rolling bearings in plummer blocks or block bearing housings on welded pedestals. For belt-driven motors, installation can be on concrete beds, welded supports, or base frames.
- Fan Housing: Fabricated with a heavy, welded steel design using S235JRG2 or specialized material, featuring additional stud bracings and profiles for enhanced durability and stability.
- Impeller with backwards bended blades statically and dynamically levered according to VDI 2056 smaller Q 6,3; dependent on size and loading steel- or casting hub with groove or TaperLock hub
- Impeller: Designed with backwards bent blades, statically and dynamically levered according to VDI 2056 smaller Q 6,3; dependent on size and loading steel- or casting hub with groove or TaperLock hub.

## Extent of supply:

The equipment mentioned above normally is completed by:

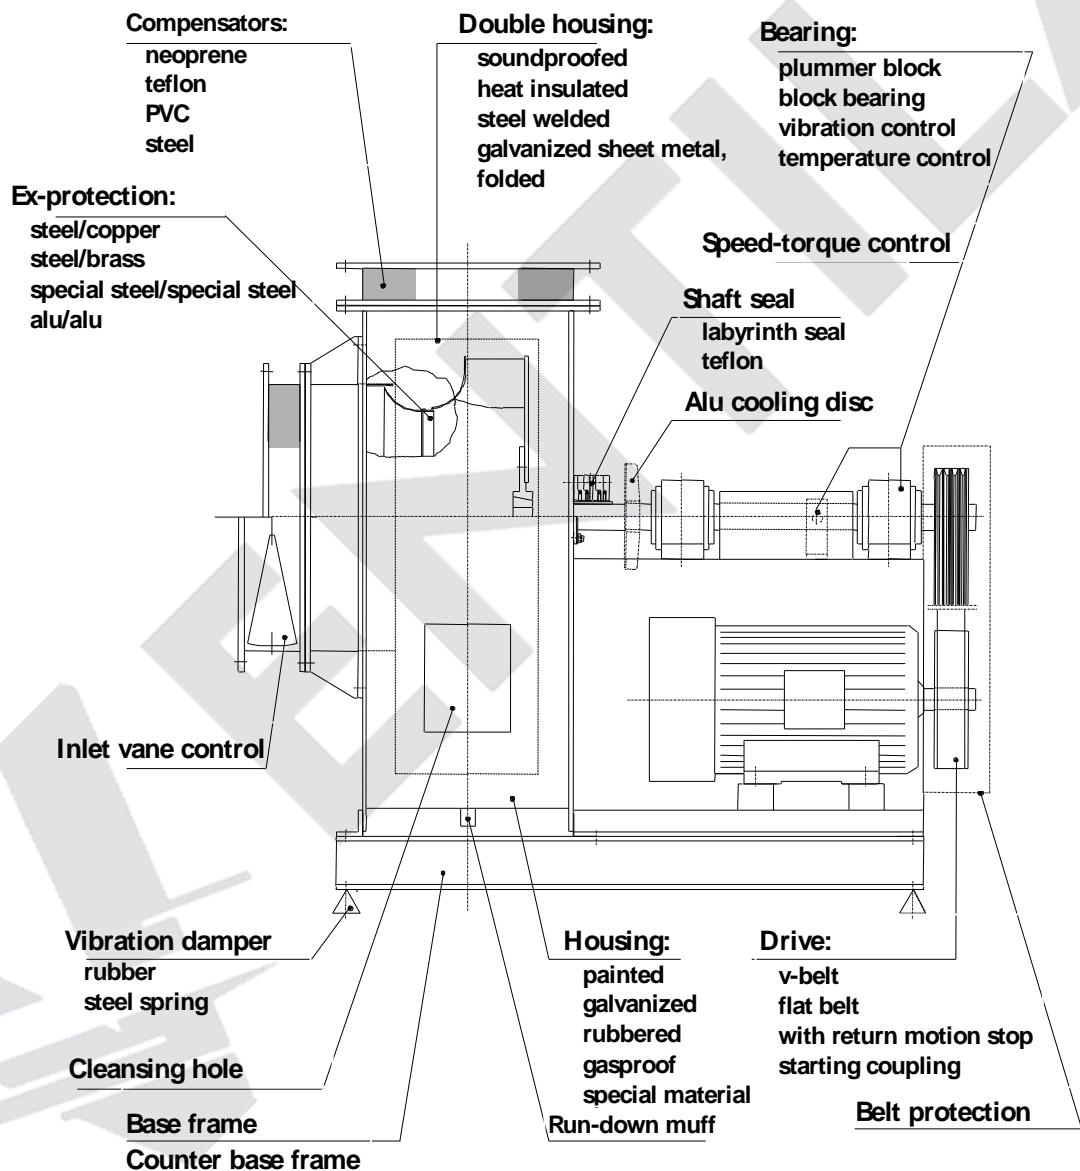

- Slide rails, if belt-driven
- Belt drive with belt guard divided 1/3 to 2/3t
- Protective grating on suction side, if connection type is E

## Appendage:

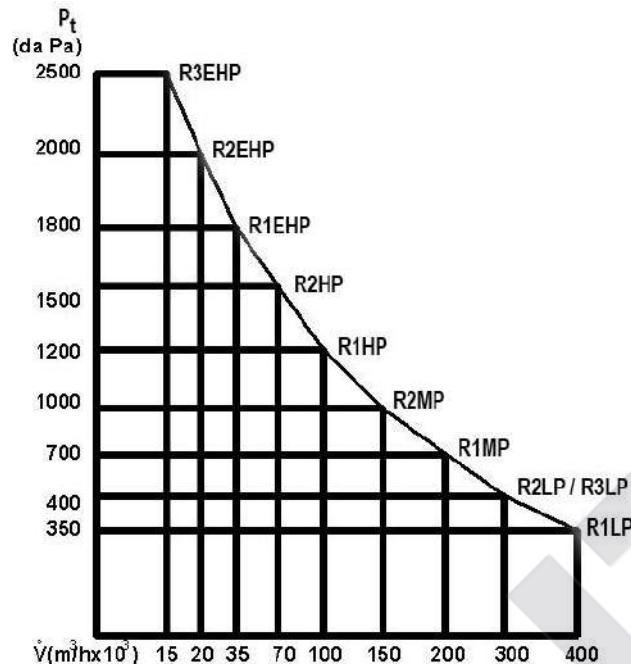

On the following page a big number of attachment is presented. Furthermore the following special versions and efforts are deliverable:

- Double inlet low pressure version for higher air flow rates
- Rectifier to stabilize the air flow on suction side
- Compensators with or without guarding sheets
- Protective gratings for both sides
- Multiple divided housing
- Galvanization or spraying alitation, special painting
- Impeller with hollow blades, interdisc or skeleton blades made of special materials
- Abrasionproof coated impeller blades
- Impeller statically and dynamically levered according to VDI 2056 smaller Q 2,5
- Different drives: V-belt-drive, flat-belt-drive, gear transmission with or without cardan, link-motion, direct drive with elastic coupling
- Cooling air tubes to cool the bearings
- Lubricating conductions
- Special motors
- Motor-addition by the customer
- Frequency converter
- Return motion stop
- Mounting and start-up
- Maintenance contract

## Versions and appendage

## Preliminary assessment for a prompt determination of the ideal series

With the following schedule you can realize the great variety of our radial fans:

Series	type	areas of application				
		pure gas	medium with dust part dry	circulating air	material transport	fibre transport
low pressure	R1LP			U-R1LP		
	R2LP		R3LP	U-R2LP		
average pressure	R1MP		R1MP	U-R1MP	R1MPFF	R1MPFF
	R2MP		R2MP	U-R2MP	R2MPF	R2MPFF
high pressure	R1HP		R1HP		R1HPF	R1HPFF
	R2HP		R2HP		R2HPF	R2HPFF
	R1EHP					
	R2EHP					
	R3EHP					

standards designation: z.B.: R1LP a ex 500 DD GR360

| | | | | |  
1 2 3 4 5 6

1 = type designation (U-...: circulator without spiral housing / R = radial with single inlet / LP = Low Pressure)

2 = abnormal impeller: z.B. intermediate blades, b < normal, D2 < or > normal

3 = ex-protection

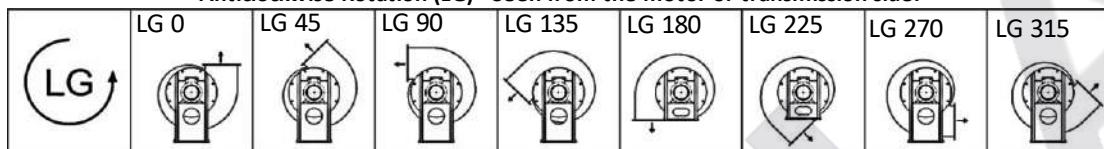

---

4 = suction size  
5 = drive: DDF = direct drive with flange motor  
DD = direct drive with B3-motor on welded support  
C = direct drive by means of an elastic coupling  
BD = belt drive, motor on base frame  
6 = housing position: RD = right-handed, LG = left-handed

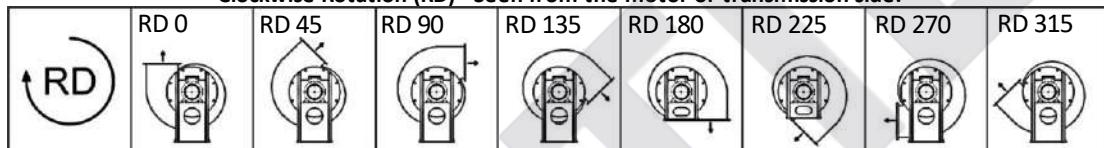

## RADIAL VENTILATORS HOUSING POSITIONS (According to ISO)

The centrifugal fans are mounted 16 orientation positions according to ISO.(8 RD and 8 LG).

Anticlockwise Rotation (LG) - Seen from the motor or transmission side.

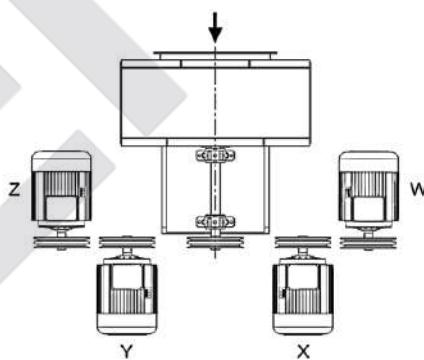

Clockwise Rotation (RD) - Seen from the motor or transmission side.

RD,LG 180 and 225 are only possible with appropriate constructive adjustments.

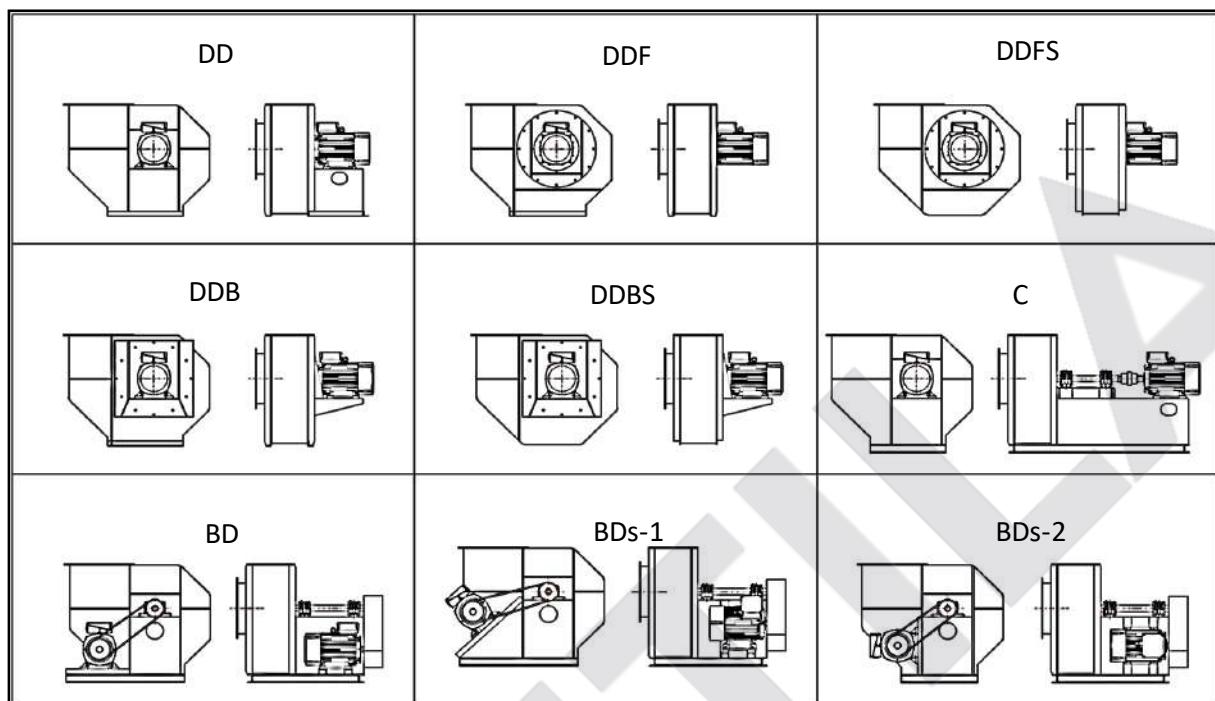

## MOTOR POSITIONS FOR THE BELT DRIVE CENTRIFUGAL VENTILATORS (According to ISO)

## Control of Inlet Vanes

In various applications of radial fans, achieving infinitely variable performance regulation is often desired. In addition to electronically controlled frequency converters, inlet vane control stands out as a cost-effective and functional alternative.

### Purpose:

Prior to reaching the impeller, the airflow passing through the fan undergoes a pre-torsion due to adjustable guide blades. Consequently, the airflow is enveloped by a rotating stream, causing individual air particles to follow helical paths towards the impeller.

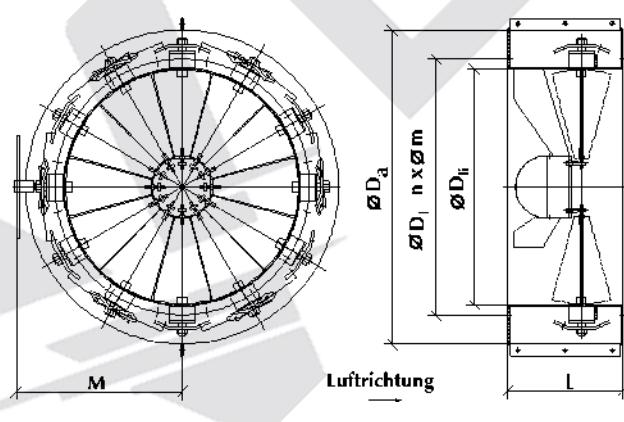

### Possibilities of regulation:

The guide blades of the inlet vane control can be shifted on three different ways

1. Directly by hand
2. By an actuator and a differential pressure controller
3. By an actuator controled by pressure transducer, temperature transducer, etc

### Advantages:

- By the changeable guide blades of the inlet vane control the fan's performance can be regulated in a broad area, if the fan's revolutions are constant.
- For this reason we are able to apply robust three phase current motors.
- Radial fans with inlet vane control offer in opposite to throttle regulation remarkable performance savings.

## Explosion protection according to VDMA 24169 part 1

The fans contained in this catalogue can be delivered corresponding to that recommendations with the type designation „ex“. However a small power loss, which must be compensated with a bit more revolutions and so a little increased power consumption, can't be avoided because of the provided bigger impeller tip clearance. Nevertheless the sheets with characteristic curves can be used to choose the desired nominal size. To get the exact data referring to power consumption and revolutions please ask us.

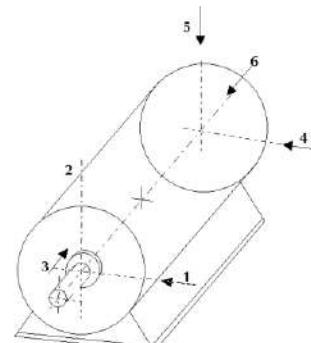

suction from zone *	2	2	1	0 => 1m if possible >= 2	0
installation within zone	>= 2	1	>=1		0
construction permission	-	-		provided!	
material combination (rotating against stationary)	-	on no account steel with light metal, steel with steel permitted!		Steel with bronze, brass, copper	
bearing	-	only rolling bearings, fatigue durability at least 40.000h			
impeller	-	must be protected on the shaft against torsion and displacement!			not per- mit- ted
Tip clearance (radial + axial)	-	axial fan from the impeller's outside diameter >=1% }however always >=2 mm radial fan from the impeller's entering diameter			
inlet, outlet	-	protected by grating s with gaps of max 12mm in breadth and height, those must be grounded			
drive	-	conductive v-belts, 1 piece more than usual	no belt drive		
grounding resistance	-	for every metal part and electrically conductive layers<= 10 <sup>6</sup> Ohm			
*) zone 2: explosion hazard scarcely and only for a short time zone 1: explosion hazard sometimes zone 0: explosion hazard constant or for a long time					

## Vibration technology

Vibration designates the change of a physical quantity, which is regularly repeated to a certain extent. In ventilator production the driving motor as well as the rotor form a system in which vibration is possible.

To be able to judge a machine's vibration reaction, the vibration severity must be determined according to the VDI-recommendation 2056. For the permitted remaining unbalanced mass of rotors the VDI-recommendations 2060 are taken as the basis. Venttek balances all rotors according to the quality grade Q = 6,3. If it is

needed, the rotors can also balanced according to the quality grade Q = 2,5. Recommended measuring points according to VDI 2056:

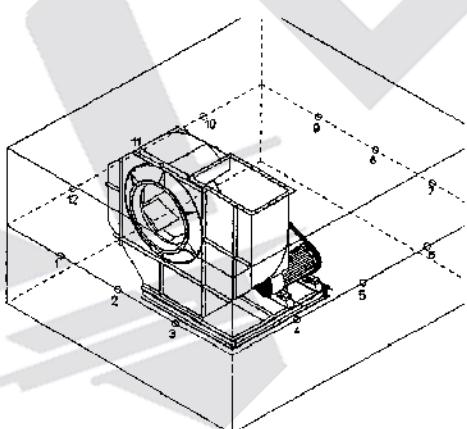

## Acoustic technology

The knowledge about the acoustic power, emitted by a machine (fan) has particular importance with respect to the linked noise

pollution of people within the housing and working domain and the connected laws. Apart from theoretical reflections - to determine acoustic values with operation parameter as a basis - noise mensurations are necessary to be able to give exact information. The basis of noise mensurations with fans is the control system:

DIN 45635 - noise mensuration with machines , airborne noise emission and in this case the enveloping surface method particularly for fans DIN 45635, part 1

This measuring method is a noise measuring procedure in order to determine the acoustic power, emitted by a machine into the surrounding air (airborne noise emission), with the help of acoustic pressure level mensurations on the enveloping surface, which surrounds the machine and which is penetrated by the emitted acoustic power. This actually means, that the acoustic level is registered at single, quite few measuring points. The resulting values are used to calculate the average, to which the measuring surface dimension, a logarithmic quantity, is added. With the help

of this procedure the acoustic capacity can be determined. The human ear feels deep frequencies much softer than high ones, that means its sensitivness depends on the frequencies. To consider this effect a defined conversion of the physical acoustic pressure level into the human ear's

sensitivness, the A-valuation, was introduced.

The A-acoustic capacity LPA can be figured out with the measuring surface's acoustic pressure level LA and the measuring surface dimension LS according to DIN 45635 sheet 1. It is held  $LPA = LA + LS$ .

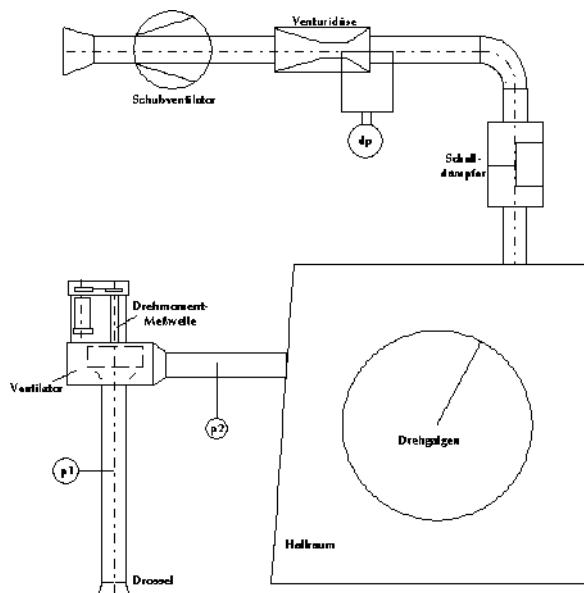

Example for enveloping surface method related to a reflecting surface plane

measuring points (1-12)  
measuring path  
reference right parallelepiped (fan)  
reflecting surface plane

## Measuring technology

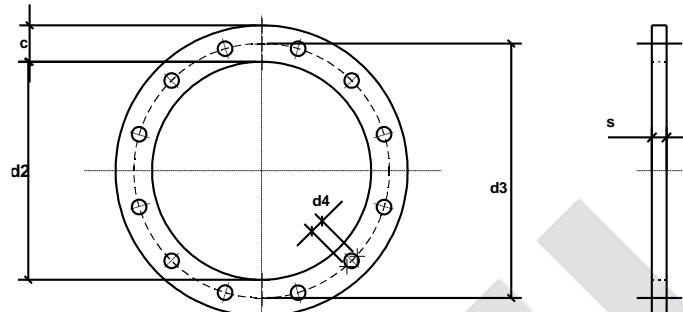

All characteristic curves contained in this catalogue were drawn up with the help of the MEISSNER + WURST test bench according to DIN 24163.

The following illustration shows the construction of the test bench.

## Flanges

All suction-sided flanges correspond to DIN 24154, part 2, row 2 and are made according to the dimensions comprised in the following schedule. If a series also has a round outlet on the pressure side, the following dimensions can be taken for the pressure-sided flanges, too. If there is a rectangular outlet, you will find the corresponding flange dimensions under the respective series within the sheets with dimensions and characteristic curves.

nominal size	inside-Ø d2		breadth x thickness c x s	hole circle-Ø d3 + 0,5	hole-Ø d4 + 0,5	number of holes	screws

## Application of sheets with characteristic curves

The sheets with characteristic curves contain the fan characteristic curves for standard revolutions, from which the engines' really existing revolutions can be taken out coincidently. If it is necessary, intermediate values can be interpolated.

The sheets with characteristic curves show the following data:

**In the diagram section at the bottom**  
 on the left ordinate the air flow volume V in m<sup>3</sup>/s  
 on the absciss the air speed c within the inlet and outlet  
 on the right ordinate the fan's nominal size

**In the left upper diagram section**  
 on the left ordinate the total pressure difference in Dpt in daPa  
 on the isodynamic lines the efficiency  $\eta$  in %.

**In the right upper diagram section**  
 on the right ordinate the peripheral speed u<sub>2</sub> in m/s  
 on the absciss below the fan's number of revolutions n in 1/s  
 on the absciss above A-estimation correction value db(korr) = (L(w) - L(w<sub>a</sub>) in dB(A).

the unevaluated acoustic capacity L(w) in dB(A) is directly put down on the characteristic curves

if total pressure difference is given and air flow volume is known, the revolutions, acoustic values etc. can be determined by the following procedure (the example shows it for a fan with a nominal size of 500)

- Starting from the ordinate in the diagram section at the bottom a horizontal line from the air flow volume value to the

isodynamic line for the nominal size of 500 must be drawn

- From this point a vertical line has to be drawn to the upper diagram section now
- After that pace an also horizontal line from the total pressure difference value must be put down. The point of intersection with the line from 2. marks the operation point for the fan. The corresponding efficiency can be read along the isodynamic line on the upper absciss. If you follow the interrupted line in left direction, you can determine the uncorrected acoustic capacity at the line's end.
- Afterwards you follow the fan characteristic curve in right direction down to the last isodynamic line. From this point of intersection a horizontal line to the isodynamic line of nominal size 500 has to be drawn. This isodynamic line finally leads to the A-estimation correction value. A vertical line to the absciss below shows at last the fan's revolutions.
- The dynamic pressure part can be determined by the following pace: Starting from the point of intersection of the line resulting in 2. with the isodynamic line „p(dyn)“, you turn horizontally to the left ordinate. By doing so you will get the value you search for.

If you intend to find out the nominal size, the corresponding procedure will be nearly identical. However, you start with 3. and draw the line to that characteristic curve section within which the optimal efficiency lies (always within the decreasing characteristic curve section). From this point you must turn vertically down and search

---

the point of intersection between air flow volume and nominal size.

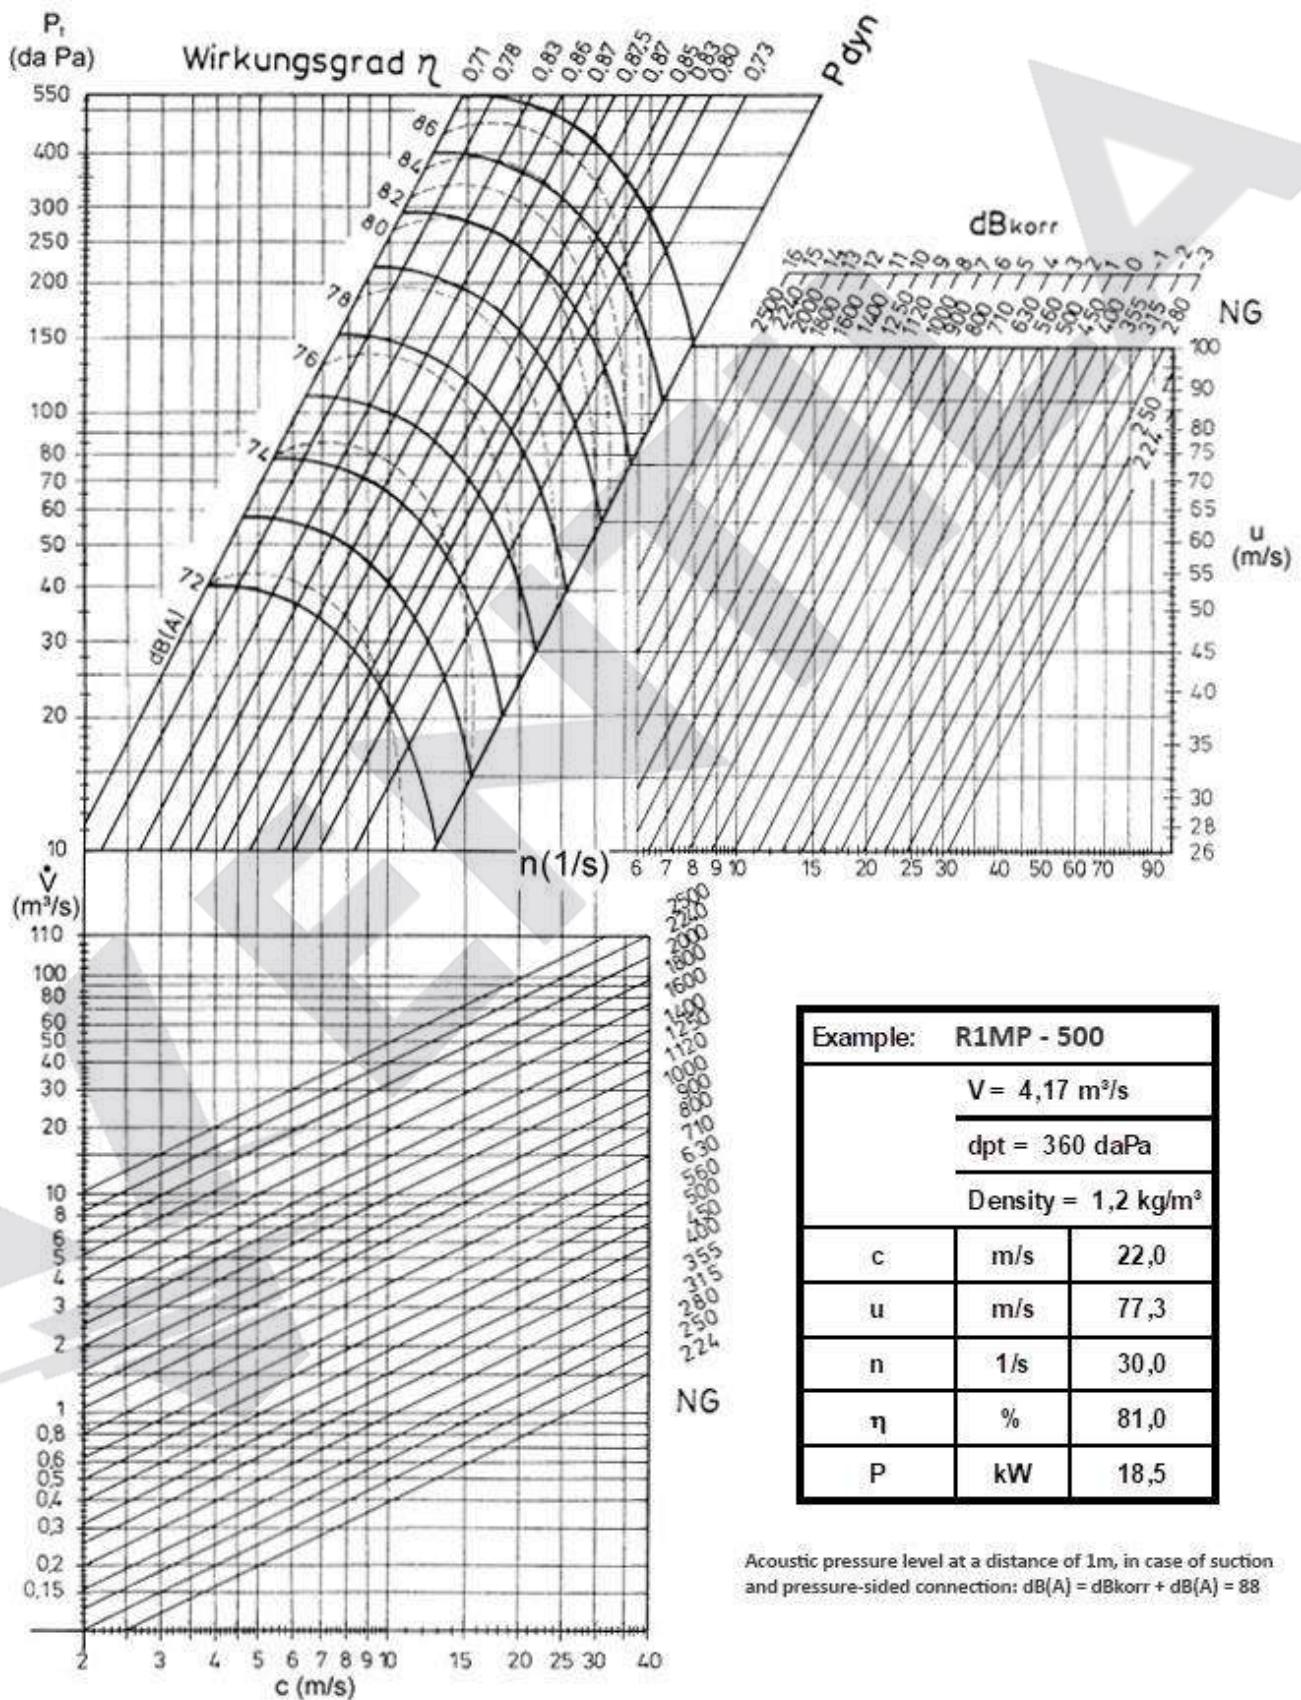

If you desire the exact need of performance for the corresponding operation point, you can use the following formula.

$$P(w) \text{ (kW)} = \frac{V(m^3/s) \cdot \Delta p(t) \text{ (daPa)}}{\eta (\%)} \quad \text{VENTILA}$$

to get it. For the choice of the drive engines the maximal need of performance is substancial. The engine's nominal performance should be with directly driven fans respectively with fans with coupling about 10% higher and with belt driven fans about 20% higher.

\*) 1 daPa = 10 Pa = 0,1 mbar = 1 kp/m<sup>2</sup> = ca.  
1 mmWS

---

Program furthermore contains:

Industrial fans in radial construction

Smoke gas fans

Multiple stage fans

Pressure and shock resistant fans

High pressure fans

Hot gas fans

Built-in fans without casing

Portable fans in radial and axial design in explosion proof construction  
for zone I and II
